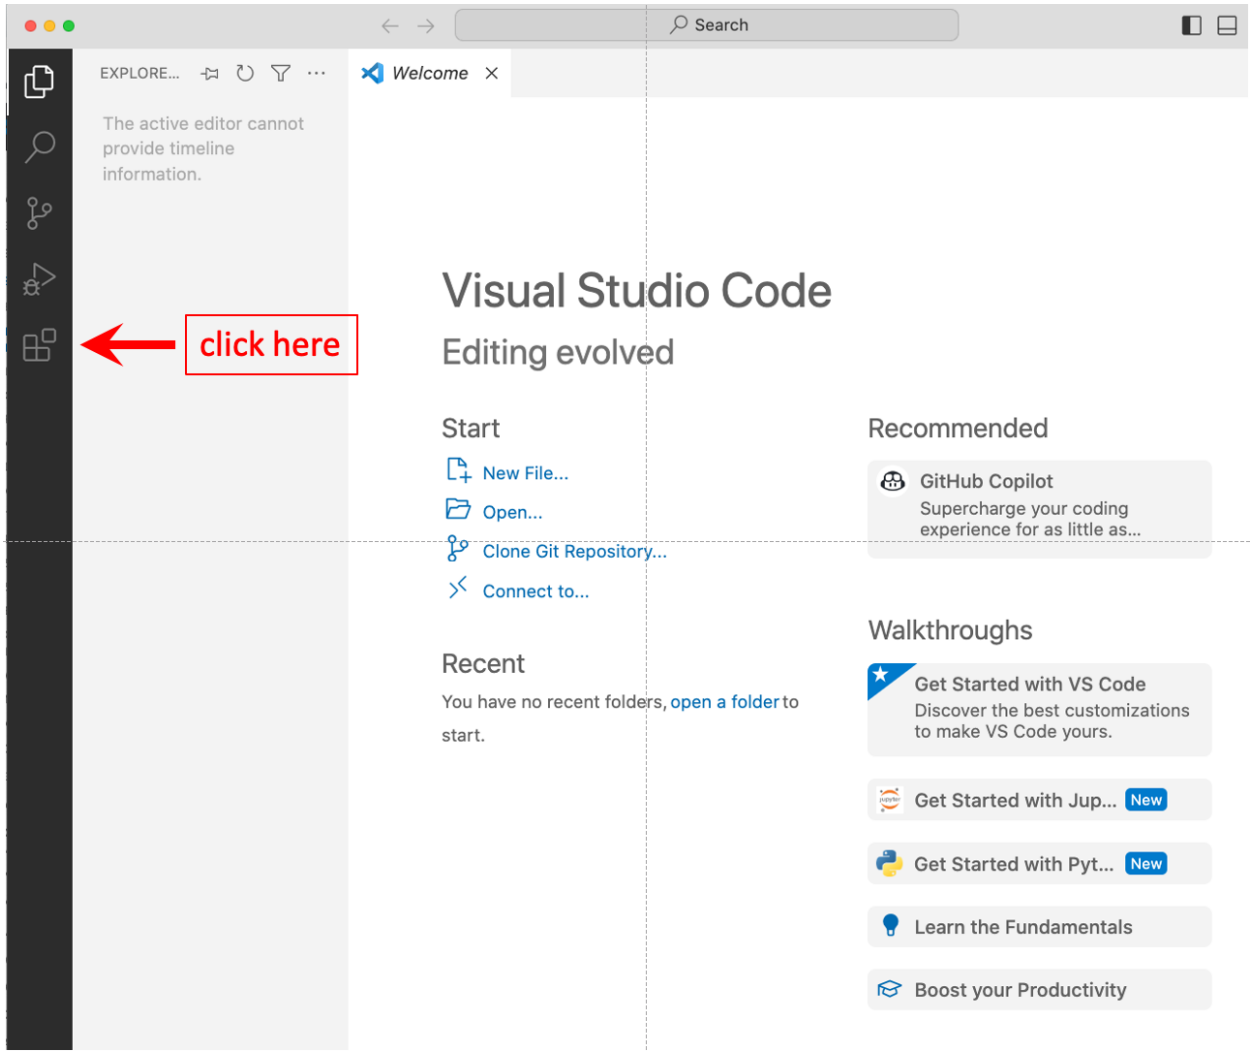
Installing and configuring VS Code

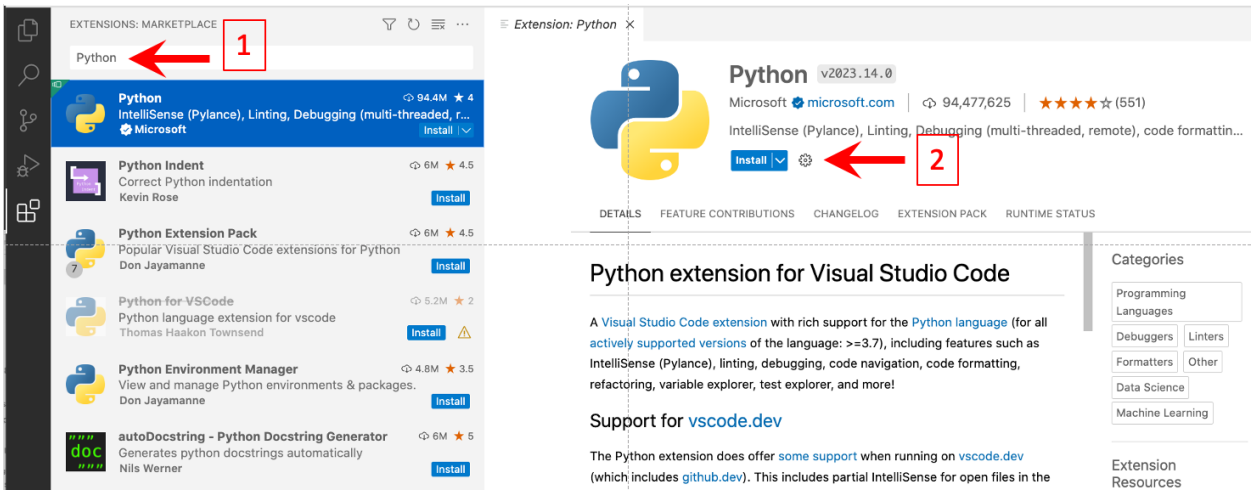
1. **Download and install Microsoft Visual Studio Code.** Point your browser to the VS Code website and install the appropriate version. **WINDOWS USERS**: Do this within your Virtual Environment, so launch your VE, open a web browser within your VE, and download VS Code. If you installed Ubuntu when setting up your VE, then you will download the *.deb file.

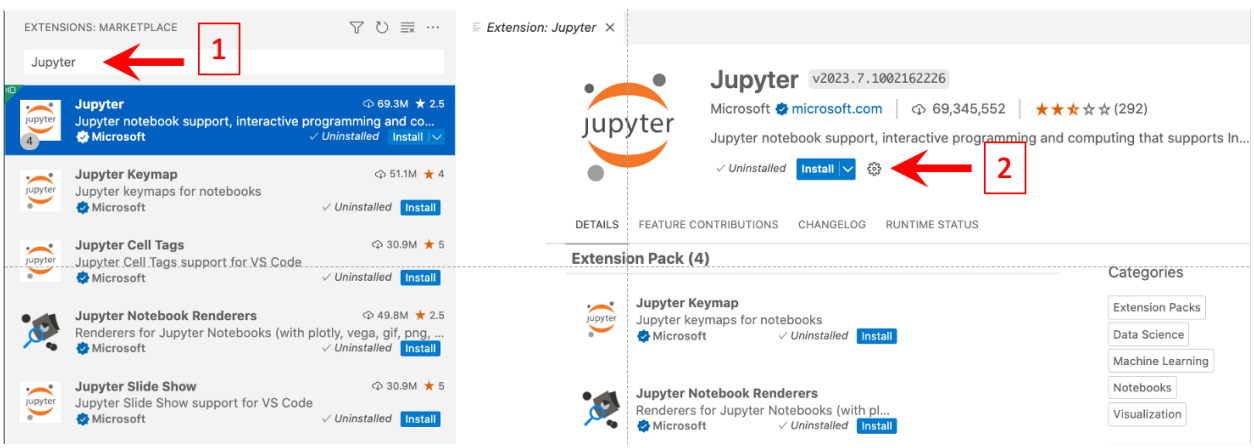
2. **Configure Microsoft Visual Studio Code**. Yours may look a little different, but after launching VS Code, you should see something like this:



- Click the `Extensions` icon on the left.

- Search for `Python`, then click to install (or possibly reload) Python.





- Search for `Jupyter`, then click to install (or possibly reload) Jupyter.
